asecos unveils new under bench cabinet with built in refrigerating unit and recirculating air filtration system

German safety storage specialist asecos has launched a newly-developed fire-resistant Type 90 under bench cabinet with refrigerating/ air filtration unit that allows secure, refrigerated storage of flammable liquids to max. +2°C.

Safety and energy efficiency are further enhanced by the integrated recirculating air system with ten-fold air exchange inside the cabinet, which effectively prevents the build-up of condensation, as well as guarding against the formation of flammable gas-air mixtures inside the cabinet. Constant refrigeration is guaranteed by the continuous flow of cold air.

External connection to an exhaust air system is not necessary with the innovative asecos system, allowing flexible installation and location of the cabinet. With a height of 630 mm, the cabinet can be easily placed under most working areas.

There is enough space to keep containers inside the cabinet, which also features a second level drawer, perfect for the storage of small containers. The unit comes complete with a port offering the option to connect to an external alarm system.

About asecos:

The company asecos, with its headquarters in Gründau (Germany), was founded in 1994. Since 17 years, asecos is dedicated to the research and development of innovative products for a safe storage and handling of hazardous materials. Nowadays, the product range comprises more than 1.700 technical solutions for handling, safe transport or ventilation of hazardous materials – inside and outside of buildings. Among others, the product range includes safety storage cabinets and gas cylinder cabinets (according to EN 14470-1/-2), hazardous material workplaces, pallets and sumps. In 2006, asecos has introduced a new business segment which consists of solutions for air purification and non-smokers' protection. All products are produced in Germany. asecos' service offer includes worldwide product maintenance and customer support.
